

KEN-08
PULSED - JET FILTRATION TRAINING SYSTEM

Pulsed - Jet Filtration Training System Model KEN-08 has been designed for demonstrating dust pollution control using a fabric filter and for investigating the effects of varying total filtration area on filtering efficiency. In addition, students can study the effects of varying gas-to-cloth (G/C) ratio between pressure drop, ΔP and inlet velocity, v_i .

The system comprises of a bag house, a pulse-jet cleaning system, a dust feeding system and a variable speed air blower. The bag house is divided into two sections: top and bottom. The top section is of stainless steel construct, connected to the compressed air tank to form part of the pulse-jet cleaning mechanism. The bottom section is made of rigid transparent polycarbonate with dust collector. Through this bottom section, students can view the filtering and cleaning operations of the bag filtering system. The cleaning mechanism comprises of a compressed air tank, a solenoid valve with remote selectable timer and a portable air compressor unit. Four units of polyester fabric filters are installed in a row inside the bottom section of the bag house. An air blower installed at the outlet is capable of drawing 198 m³/hr of air through the system. The air inlet velocity can be varied by means of adjusting the air blower speed. A dust feeding system is provided for introducing a desired amount of dust particles into the air stream before entering the bag house. The pressure drop, ΔP across the bag house can be measured by a differential pressure meter. The entire system is mounted on a skid platform with an epoxy-coated steel frame and lockable castor wheels for mobility. All the necessary instruments are housed within a dust and splash proof control console with IP 55 rating. The system comes with complete PVC piping connections.

Experiments

- Demonstration of a bag filtering system in dust pollution control
- To study the effects of varying total filtering area
- To investigate the effects of varying gas-to-cloth (G/C) ratio on separation efficiency
- To verify the relationship between pressure drop, ΔP and inlet velocity, v_i

Technical Specifications
a) Bag house

- No. of sections : 2
- 1Top section material : Stainless steel
- Dimensions : 890 mm (L) x 380 mm (W) x 200 mm (H)
- Btm. section material : Clear polycarbonate
- Accessories : Dust collector

b) Fabric filter

- Material : Polyester
- Dimensions : 13.5 cm (D) x 100 cm (H)
- Mount : Support cage to prevent collapse

Note : Specification & Photos can be altered without notice in our constant efforts for improvement

c) Pulse-jet cleaning system

- Compressed air tank
- Capacity : Approx. 20 L
- Material : Stainless steel
- Accessories : Pressure relieve valve 0 to 2 bar
- Air compressor : Portable type 1 hp
- Cleaning nozzles for each fabric filter
- Solenoid valve with remote selectable timer

d) Air blower

- Rated power : 2 hp
- Max. air delivery : 198 m³/hr @ 2800 rpm
- Max. static pressure : 69 in H₂O
- Speed controller : Frequency inverter

e) Air flow meter

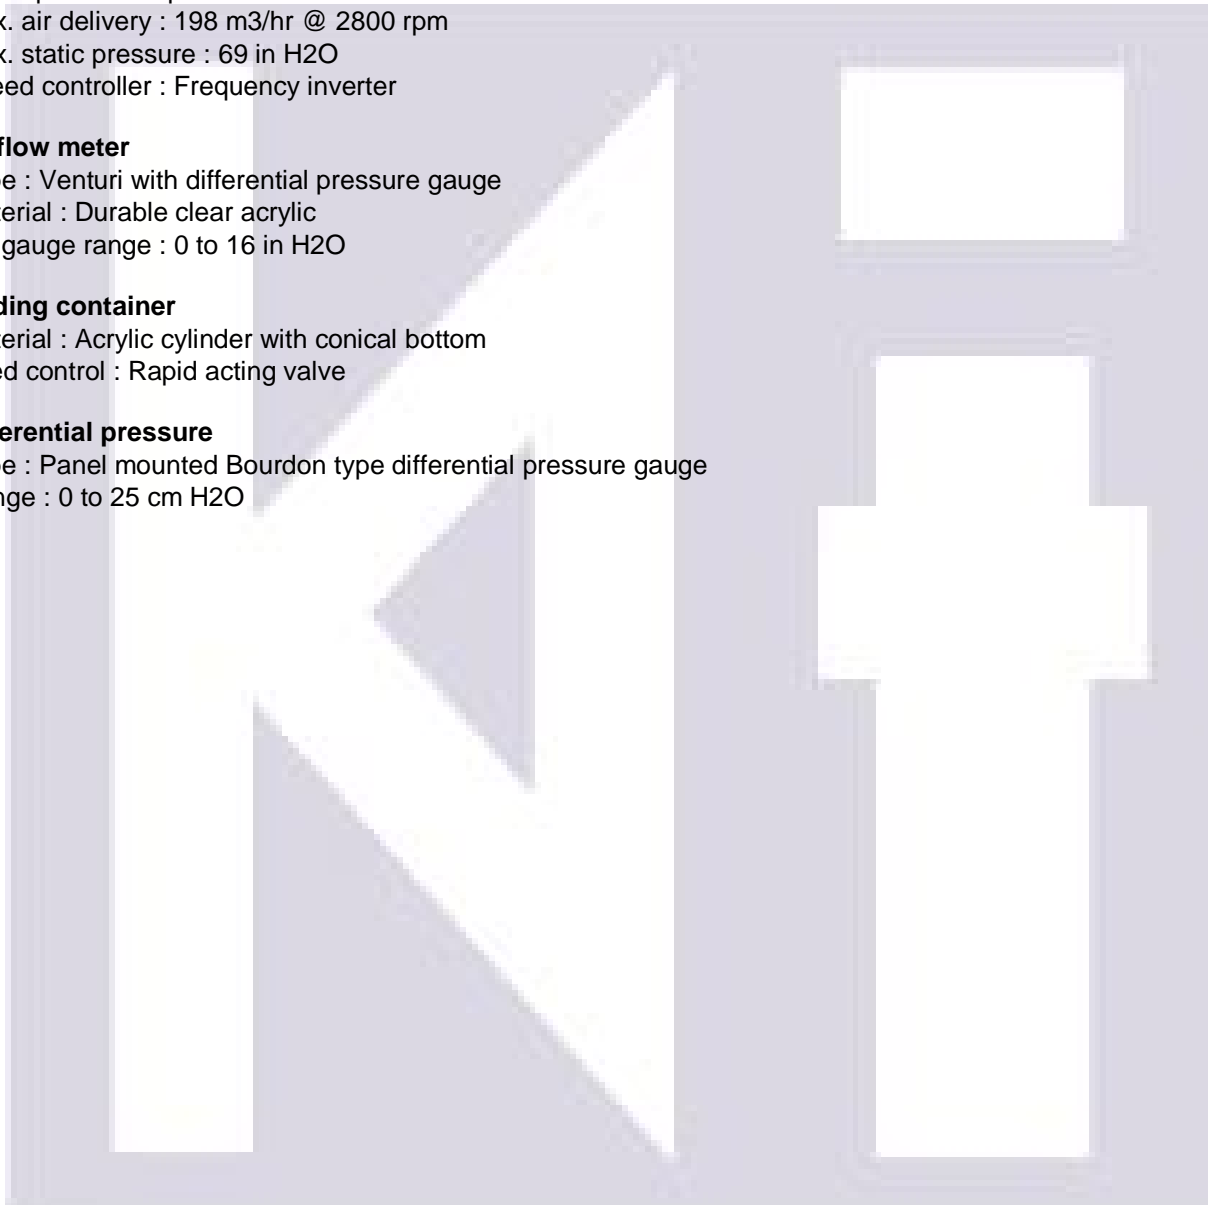

- Type : Venturi with differential pressure gauge
- Material : Durable clear acrylic
- DP gauge range : 0 to 16 in H₂O

f) Feeding container

- Material : Acrylic cylinder with conical bottom
- Feed control : Rapid acting valve

g) Differential pressure

- Type : Panel mounted Bourdon type differential pressure gauge
- Range : 0 to 25 cm H₂O

Note : Specification & Photos can be altered without notice in our constant efforts for improvement
